

# HW4: Multimodal AI – Visual Instruction Tuning (VQA)

314833008 Lee Jiexin (李捷新)

## 1. Title Page

**Student:** 314833008 Lee Jiexin (李捷新)

**GitHub:** <https://github.com/fader2077/Recurrent-Neural-Network-and-Transformer-HW/tree/main/hw4>

## 2. Overview

This report preserves the original HW4 required experiment and extends it with controlled re-evaluation, conservative metrics, and stricter qualitative checks.

## 3. Dataset Choice

ChartQA is selected because chart VQA requires numeric reading, legend grounding, color recognition, and trend reasoning.

## 4. Model and Method

Base model: LLaVA-v1.5-7B. Quantization: 4-bit NF4. Fine-tuning method: QLoRA / PEFT LoRA.

## 5. Training Setup

Original required setup is preserved. The official v2 run uses a custom multimodal Trainer/PyTorch-style loop with a custom collator, assistant-only loss masking (labels for answer tokens only), padding labels=-100, train[:1000], 3 epochs, q/v LoRA targets, learning rate 1e-4, batch size 1, gradient accumulation 16, 4-bit NF4, frozen vision tower and frozen projector, and no truncation.

## 6. Original 5-Case Evaluation

### Case 0

#### Germans previously viewed China less favorably than Americans did, but attitudes have converged of late

Favorable views of China

100%

Source: Spring 2018 Global Attitudes Survey. Q17b.

PEW RESEARCH CENTER

**Question:** What's the color of graph with 56 as the highest value?

**Ground Truth:** Blue

**Base Model Answer:** The color of the graph with 56 as the highest value is blue.

**Fine-tuned Answer:** Blue

**Analysis:** Both models identify the correct color. The base model gives a verbose sentence, while the fine-tuned adapter returns the concise label.

### Case 1

#### Germans previously viewed China less favorably than Americans did, but attitudes have converged of late

Favorable views of China

100%

Source: Spring 2018 Global Attitudes Survey. Q17b.

PEW RESEARCH CENTER

**Question:** In which year the difference between blue and green graph 1?

**Ground Truth:** 2018

**Base Model Answer:** The difference between the blue and green graphs in 2011 is 1.

**Fine-tuned Answer:** 2005

**Analysis:** The base model predicts 2011 and the adapter predicts 2005; both miss the ground-truth year 2018.

## Case 2

### Belief that U.S. considers other countries' interests in foreign policy returns to 2007 level

*In making international policy decisions, to what extent do you think the U.S. takes the interest of your country into account?*

Note: 14-country median based on Argentina, Canada, France, Germany, Indonesia, Israel, Japan, Kenya, Mexico, Poland, Russia, South Korea, Spain and the UK.

Source: Spring 2018 Global Attitudes Survey. Q39.

PEW RESEARCH CENTER

**Question:** What does the blue line represent?

**Ground Truth:** Not too much/not at all

**Base Model Answer:** The blue line represents the percentage of foreign policy decisions made by the United States.

**Fine-tuned Answer:** The blue line represents the value of the foreign policy.

**Analysis:** Both models miss strict legend grounding and do not return the exact chart label.

### Case 3

#### Belief that U.S. considers other countries' interests in foreign policy returns to 2007 level

*In making international policy decisions, to what extent do you think the U.S. takes the interest of your country into account?*

Note: 14-country median based on Argentina, Canada, France, Germany, Indonesia, Israel, Japan, Kenya, Mexico, Poland, Russia, South Korea, Spain and the UK.

Source: Spring 2018 Global Attitudes Survey. Q39.

PEW RESEARCH CENTER

**Question:** What is the max value of blue line?

**Ground Truth:** 0.72

**Base Model Answer:** The max value of the blue line is 70%.

**Fine-tuned Answer:** 1.0

**Analysis:** The base model predicts 70% and the adapter predicts 1.0; both miss the ground truth 0.72.

## Downward trend in public views of economic issues as 'top priority'

*% who say \_\_\_\_ is a top priority for the president and Congress*

Source: Survey of U.S. adults conducted Jan. 10-15, 2018.

PEW RESEARCH CENTER

**Question:** What's the percentage of respondents who say Job is a top priority for the president and Congress in 2016?

**Ground Truth:** 68

**Base Model Answer:** In 2016, 67% of respondents indicated that jobs were a top priority for the president and Congress.

**Fine-tuned Answer:** 75.75

**Analysis:** The base model predicts 67 and the adapter predicts 75.75; both miss 68.

## 7. Original Loss Curve

**Legacy diagnostic:** the earlier curve (outputs/loss\_curve.png) started near 10 and is treated as suspicious due to likely label-masking issues. **Official clean training evidence:**

The official v2 run starts around 1.52 and decreases to around 0.80, with final train loss about 1.033. This is substantially cleaner than the legacy high-loss curve and supports the corrected masking pipeline.

## 8. Additional Experiments Overview

Primary rule: fix evaluation logic and reporting consistency first, then interpret improvements conservatively.

## 9. Larger Evaluation on ChartQA val[:50]

| Model       | Exact | Norm  | NumNear | CombinedRelaxed |
|-------------|-------|-------|---------|-----------------|
| Base        | 0.000 | 0.180 | 0.100   | 0.240           |
| q/v 1ep     | 0.060 | 0.060 | 0.140   | 0.180           |
| q/v 2ep     | 0.080 | 0.120 | 0.120   | 0.220           |
| q/k/v/o 1ep | 0.060 | 0.060 | 0.100   | 0.140           |

Combined Relaxed Accuracy is a relaxed metric, not strict accuracy. Base LLaVA has very low exact match in the normal prompt setting because it often produces verbose sentence-style answers instead of short ChartQA labels.

## 10. Strict vs Relaxed Metrics

Keep strict and relaxed interpretations separate: case studies use strict ground-truth comparison, while relaxed metrics capture near-miss behavior.

## 11. Controlled Re-evaluation on ChartQA val[:200]

Generation configuration: `do_sample=False, num_beams=1, max_new_tokens=16, repetition_penalty=1.1`.

| Model             | Prompt  | Exact | Norm  | FirstNum | AnyNum | Cons  | Relaxed |
|-------------------|---------|-------|-------|----------|--------|-------|---------|
| Base              | normal  | 0.005 | 0.130 | 0.090    | 0.090  | 0.200 | 0.200   |
| Base              | short   | 0.115 | 0.125 | 0.210    | 0.210  | 0.290 | 0.290   |
| Base              | dataset | 0.130 | 0.135 | 0.210    | 0.210  | 0.305 | 0.305   |
| q/v 1ep           | normal  | 0.125 | 0.135 | 0.200    | 0.200  | 0.300 | 0.300   |
| q/v 1ep           | short   | 0.110 | 0.120 | 0.220    | 0.220  | 0.310 | 0.310   |
| q/v 1ep           | dataset | 0.110 | 0.110 | 0.225    | 0.225  | 0.305 | 0.305   |
| q/v 2ep           | normal  | 0.120 | 0.130 | 0.195    | 0.195  | 0.285 | 0.285   |
| q/v 2ep           | short   | 0.100 | 0.110 | 0.190    | 0.190  | 0.275 | 0.275   |
| q/v 2ep           | dataset | 0.095 | 0.110 | 0.175    | 0.175  | 0.260 | 0.260   |
| q/k/v/o 1ep       | normal  | 0.110 | 0.115 | 0.185    | 0.185  | 0.275 | 0.275   |
| q/k/v/o 1ep       | short   | 0.100 | 0.110 | 0.195    | 0.195  | 0.285 | 0.285   |
| q/k/v/o 1ep       | dataset | 0.100 | 0.105 | 0.175    | 0.175  | 0.255 | 0.255   |
| q/v clean 3ep     | normal  | 0.080 | 0.285 | 0.265    | 0.275  | 0.460 | 0.460   |
| q/v clean 3ep     | short   | 0.055 | 0.255 | 0.245    | 0.255  | 0.430 | 0.435   |
| q/v clean 3ep     | dataset | 0.025 | 0.250 | 0.245    | 0.250  | 0.425 | 0.425   |
| q/k/v/o clean 2ep | normal  | 0.105 | 0.230 | 0.250    | 0.255  | 0.400 | 0.405   |
| q/k/v/o clean 2ep | short   | 0.105 | 0.230 | 0.255    | 0.260  | 0.415 | 0.420   |
| q/k/v/o clean 2ep | dataset | 0.085 | 0.225 | 0.265    | 0.270  | 0.420 | 0.425   |

## 12. Conservative vs Relaxed Metrics

Combined Conservative Accuracy (Cons) is the main metric after observing unstable long numeric strings. Combined Relaxed Accuracy (Relaxed) is retained as an upper-bound relaxed metric.

## 13. Answer Stability Diagnostics

| Model             | Prompt  | MultiNum | Overlong | Repeat | AvgLen | Verbose |
|-------------------|---------|----------|----------|--------|--------|---------|
| Base              | normal  | 0.000    | 0.140    | 0.000  | 11.105 | 0.955   |
| Base              | short   | 0.000    | 0.000    | 0.000  | 1.280  | 0.035   |
| Base              | dataset | 0.000    | 0.000    | 0.000  | 1.140  | 0.015   |
| q/v 1ep           | normal  | 0.000    | 0.005    | 0.000  | 1.800  | 0.075   |
| q/v 1ep           | short   | 0.000    | 0.000    | 0.000  | 1.085  | 0.005   |
| q/v 1ep           | dataset | 0.000    | 0.000    | 0.000  | 1.065  | 0.000   |
| q/v 2ep           | normal  | 0.000    | 0.000    | 0.110  | 1.415  | 0.060   |
| q/v 2ep           | short   | 0.000    | 0.000    | 0.080  | 1.065  | 0.000   |
| q/v 2ep           | dataset | 0.000    | 0.000    | 0.120  | 1.035  | 0.000   |
| q/k/v/o 1ep       | normal  | 0.000    | 0.000    | 0.000  | 1.570  | 0.075   |
| q/k/v/o 1ep       | short   | 0.000    | 0.000    | 0.000  | 1.085  | 0.010   |
| q/k/v/o 1ep       | dataset | 0.000    | 0.000    | 0.000  | 1.010  | 0.000   |
| q/v clean 3ep     | normal  | 0.035    | 0.015    | 0.430  | 2.870  | 0.260   |
| q/v clean 3ep     | short   | 0.035    | 0.005    | 0.415  | 2.835  | 0.270   |
| q/v clean 3ep     | dataset | 0.050    | 0.000    | 0.450  | 2.805  | 0.290   |
| q/k/v/o clean 2ep | normal  | 0.020    | 0.005    | 0.425  | 2.105  | 0.160   |
| q/k/v/o clean 2ep | short   | 0.025    | 0.010    | 0.395  | 1.940  | 0.115   |
| q/k/v/o clean 2ep | dataset | 0.010    | 0.005    | 0.410  | 1.925  | 0.140   |

Base LLaVA with normal prompt is verbose. Short prompts reduce verbosity. Clean adapters improve relaxed metrics but still show non-trivial repeated-fragment rates.

## 14. Label Masking Diagnostics

Diagnostics file: `outputs/additional_experiments/label_masking_diagnostics.txt`. It prints question, ground truth answer, decoded full input, decoded label tokens where labels  $\neq$  -100, and masked ratio.

## 15. Numeric Near-Miss Analysis

| Model                        | Total Numeric Questions | Strict Exact Correct | Numeric Near-Match Correct | Strict Wrong but Numeric Near-Match Correct | Numeric Near-Match Rate |
|------------------------------|-------------------------|----------------------|----------------------------|---------------------------------------------|-------------------------|
| Base LLaVA                   | 32                      | 0                    | 4                          | 4                                           | 0.125                   |
| Original adapter q/v 1 epoch | 32                      | 1                    | 5                          | 4                                           | 0.156                   |
| New adapter q/v 2 epochs     | 32                      | 2                    | 4                          | 3                                           | 0.125                   |
| New adapter q/k/v/o 1 epoch  | 32                      | 1                    | 3                          | 2                                           | 0.094                   |

Case studies are discussed under strict ground-truth comparison, while numeric tolerance is used only as a relaxed aggregate metric.

## 16. Clean Retraining Results

| Model             | Exact | Norm  | FirstNum | AnyNum | Cons  | Relaxed |
|-------------------|-------|-------|----------|--------|-------|---------|
| q/v clean 3ep     | 0.080 | 0.285 | 0.265    | 0.275  | 0.460 | 0.460   |
| q/k/v/o clean 2ep | 0.105 | 0.230 | 0.250    | 0.255  | 0.400 | 0.405   |

Clean retraining improves relaxed aggregate metrics, especially normalized matching and numeric near-match. Exact match remains much lower than relaxed metrics.

## 17. Controlled Final Clean Adapter 5-Case Check

Main table shows shortened outputs (max 60 chars); full outputs are saved to CSV/JSON. For official v2, the three repeated rows for each case correspond to normal, short-answer, and dataset-style prompts.

| Case | Model       | Prompt  | GroundTruth             | Answer                                                          |
|------|-------------|---------|-------------------------|-----------------------------------------------------------------|
| 0    | Base        | normal  | Blue                    | The color of the graph with 56 as the highest value is blue.    |
| 0    | official v2 | normal  | Blue                    | Green                                                           |
| 0    | official v2 | short   | Blue                    | Green                                                           |
| 0    | official v2 | dataset | Blue                    | Green                                                           |
| 0    | q/v 1ep     | normal  | Blue                    | Blue                                                            |
| 1    | Base        | normal  | 2018                    | In the year 2008, there is a noticeable difference in           |
| 1    | official v2 | normal  | 2018                    | 2013                                                            |
| 1    | official v2 | short   | 2018                    | 2008                                                            |
| 1    | official v2 | dataset | 2018                    | 2008                                                            |
| 1    | q/v 1ep     | normal  | 2018                    | 2005                                                            |

| 3    | official v2 | normal  | 0.72                    | The maximum value of the blue line, which represents “not to... |
| 3    | official v2 | short   | 0.72                    | 70.1428571429 (7                                                |
| 3    | official v2 | dataset | 0.72                    | 70.526315794844                                                 |
| 3    | q/v 1ep     | normal  | 0.72                    | 1.0                                                             |
| 4    | Base        | normal  | 68                      | In 2016, 74% of respondents indicated that                      |
| 4    | official v2 | normal  | 68                      | 71.43%                                                          |
| 4    | official v2 | short   | 68                      | 71.43%                                                          |
| 4    | official v2 | dataset | 68                      | 71.43%                                                          |
| 4    | q/v 1ep     | normal  | 68                      | 57.3%                                                           |

Although the official v2 retraining improves aggregate conservative metrics versus the original q/v 1ep model on val[:200], Case 0 still regresses from Blue to Green. Therefore, strict chart reasoning is still not solved and this result is reported as a limitation.

## 18. Format-Control Evaluation

Short-answer and dataset-style prompts reduce verbosity strongly, but correctness gains are smaller than format gains. Official v2 summaries are saved to `outputs/official_qv_shortstyle_v2_train1000_3epoch/summary.csv`, `outputs/official_qv_shortstyle_v2_train1000_3epoch/val200_eval.csv`, and `outputs/official_qv_shortstyle_v2_train1000_3epoch/fixed_5case_eval.csv`.

## 19. Statistical Caution

Because the evaluation subset contains 200 examples, a 0.01 change corresponds to about two examples. Therefore, small differences should not be over-interpreted.

## 20. Final Discussion

The QLoRA pipeline satisfies the HW4 requirements and trains successfully. The original five-case evaluation shows persistent failures in exact year extraction, legend grounding, and numeric reading. The old high-loss curve is treated as suspicious, and the official clean shortstyle retraining provides cleaner training evidence with plausible loss dynamics. On val[:200], the official v2 adapter improves aggregate metrics versus the original q/v 1ep baseline under controlled generation, and Combined Conservative Accuracy is treated as the primary metric. However, exact-match and strict chart reasoning remain limited, and Case 0 still regresses to Green. Therefore, conclusions remain conservative.

## 21. Conclusion

Small differences should not be over-interpreted. On val[:200], a 0.01 difference corresponds to about two examples. The final claim is limited: fine-tuning improves format control and aggregate conservative metrics, but strict chart reasoning remains difficult.
